Boundary Value Problem Solved In

In this section we'll define boundary conditions (as opposed to initial conditions which we should already be familiar with at this point) and the boundary value problem. We will also work a few examples

problem solvers for ordinary differential equations. Boundary value problems (BVPs) are ordinary differential equations that are subject to boundary conditions. Unlike initial value problems, a BVP can have a finite solution, no solution, or infinitely many solutions. The initial guess of the solution is an integral part of solving a BVP, and the quality of the

value problem may not have a solution, or may have a finite number, or may have infinitely many. Because of this, programs for solving BVPs require users to provide a guess for the solution desired. Often there are parameters that have to be determined so that the BVP has a solution.
