Chemical Composition Of Blood Plasma And Serum

Each red blood cell is about one-third hemoglobin, by volume. Plasma is about 92% water, with plasma proteins as the most abundant solutes. The main plasma protein groups are albumins, globulins, and fibrinogens. The primary blood gasses are oxygen, carbon dioxide, and nitrogen.

Components and Composition Of

Composition of blood:
Blood consists of a watery fluid called plasma which contains certain floating bodies collectively termed as formed elements. Different kinds of blood cells like Erythrocytes (RBCs), Leukocytes (WBCs) and Thrombocytes (blood platelets) constitute up the formed elements.

critical group is the coagulation proteins and their inhibitors, synthesized primarily in the liver. When blood clotting is activated, fibrinogen circulating in the blood is converted to fibrin, which in turn helps to form a stable blood clot at the site of vascular disruption.

Britannica

Blood is the most common body fluid that transports substances from one part of the body to the other. Blood is a connective tissue consisting of plasma (fluid matrix) and formed elements. The plasma constitutes 55% of the total blood volume. The remaining 45% is the formed elements that consist of blood cells.

Blood Composition .
Blood is a circulating tissue composed of fluid plasma and cells (red blood cells, white blood cells, platelets). Anatomically, blood is considered a connective tissue, due to its origin in the bones and its function.
