Near-infrared Fourier Transform Raman spectroscopy (NIR FT-Raman) was demonstrated in a seminal article appearing in 1986, (24) the concept evolved to incorporate the reduction of fluorescence inherent to NIR excitation and the signal-averaging and throughput advantages of the optical interferometer. A Nd:YAG laser provides the NIR excitation, a quartz or other NIR beamsplitter is used in the interferometer and a NIR detector (usually, Indium Gallium Arsenide - InGaAs or Germanium - Ge) is ...

Fourier Transform Raman Spectroscopy - an overview ...

Fourier-transform spectroscopy is a measurement technique whereby spectra are collected based on measurements of the coherence of a radiative source, using time-domain or space-domain measurements of the electromagnetic radiation or other type of radiation. It can be applied to a variety of types of spectroscopy including optical spectroscopy, infrared spectroscopy, nuclear magnetic resonance and magnetic resonance spectroscopic imaging, mass spectrometry and electron spin resonance spectroscopy

Fluorescence and initiation of photoreactions are problems frequently encountered with resonance Raman spectroscopy of photobiological systems. These problems can be circumvented with Fourier-transform Raman spectroscopy by using the 1064-nm wavelength of a continuous wave neodymium-yttrium/aluminum-garnet laser as the probing beam.

Fourier transform infrared (FTIR) spectroscopy and Raman spectroscopy are chemical analytical methods that have also been used to collect information about whole bacterial cells (14). The outputs from these methods are FTIR and Raman spectra that contain signals from the organic functional groups in the sample.

We compared the two most promising techniques for MP analysis, namely, Raman and Fourier transform infrared (FTIR) spectroscopy, by analyzing MPs extracted from North Sea surface waters. Microplastics $>500 \mu\text{m}$ were visually sorted and manually analyzed by μ -Raman and attenuated total reflection (ATR)-FTIR spectroscopy.

Abstract Detailed Fourier transform Raman spectra of fluconazole have been recorded and the main spectral features of fluconazole have been assigned to its vibrational modes. Two different polymorphic forms of fluconazole were identified in two spectral regions, 150–1700 cm^{-1} and 2700–3200 cm^{-1} , respectively.

The spectral resolution of broadband Fourier-transform coherent anti-Stokes Raman spectroscopy is limited by the maximum optical path length difference that can be scanned within a short time in an interferometer. However, alternatives to the Fourier transform exist which can bypass this limitation with certain assumptions.
