Human languages are strikingly different from each other, and also strikingly the same. One of the most indecipherable codes used in World War II was Navajos speaking their native language. Yet the Navajos were able to translate messages to and from English quickly and accurately. This shows that, for all their differences, languages must have a strong common denominator.

Whether all human languages are fundamentally the same or different has been a subject of debate for ages. This problem has deep philosophical implications: If languages are all the same, it implies a fundamental commonality--and thus mutual intelligibility--of human thought. We are now on the verge of solving this problem. Using a twenty-year-old theory proposed by the world's greatest living ...

History. Originally intended as a high level hardware description language, Atom was created in early 2007 and released in open-source of April of the same year. Inspired by TRS and Bluespec, Atom compiled circuit descriptions, that were based on guarded atomic operations, or conditional term rewriting, into Verilog netlists for simulation and logic synthesis.

Atom (programming language) - Wikipedia

Lisp (historically LISP) is a family of programming languages with a long history and a distinctive, fully parenthesized prefix notation. Originally specified in 1958, Lisp is the second-oldest high-level programming language in widespread use today. Only Fortran is older, by one year. Lisp has changed since its early days, and many dialects have existed over its history.

Nowhere is this pervasive reality of human language seen more clearly than in examining the ubiquitous and indispensable features that constitute its complex grid of atoms. And yet, the article and the book it reviews show equally clearly how linguists try to bring order out of chaos in a valiant attempt to improve our understanding of this challenging inherent complexity.
